Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A_Geneseq_0601:*

The CCF-1 protein has antiparasitic, CC antibacterial and antiinflammatory activity. Recombinant coelomic CC cytolytic factor 1 (CCF-1) is trypanolytic for the African trypanosome CC Trypanosoma brucei in a dose-dependent manner. The trypanolytic activity CC of rCCF-1 can be inhibited by anti-CCF-1 and anti-tumour necrosis factor CC (TMF)/TIP monoclonal antibodies. Furthermore, N,N'-diacetlychitobiose CC corroborate the findings that CCF-1 shares a trypanolytic, lectin-like CC corroborate the findings that CCF-1 shares a trypanolytic, lectin-like CC corroborate the findings that CCF-1 shares a trypanolytic, lectin-like CC corroborate the findings that CCF-1 shares a trypanosomal or CC bacterial infections or cancer. The proteins and peptides are also useful in tumour therapy, inflammation and other areas of immunology. CT he annelid peptide is derived from a 42 kDa cytolytic protein named CC cuseful in the binds lipopolysaccharide and beta-1,3-glucan. The factor resembles the vertebrate tumour necrosis factor-alpha (TNF-alpha), and CC may be used as an alternative for TNF-alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Jery Match

The trypanolytic activity of rCCF-1 can be inhibited by anti-CCF-1 and anti-tumour necrosis factor (TNF)/TIP monoclonal antibodies. Furthermore, N.N'-diacetlychitobiose inhibits potently trypanolytic activity of rCCF-1. These data corroborate the findings that CCF-1 shares a trypanolytic, lectin-like domain with TNF-alpha. CCF-1 is useful to treat trypanosomal or bacterial infections or cancer. The proteins and peptides are also useful in tumour therapy, inflammation and other areas of immunology. The annelid peptide is derived from 42 kDa cytolytic protein named CCF-1 that binds lippolysaccharide and beta-1,3-glucan. The factor resembles the vertebrate tumour necrosis factor-alpha (TNF-alpha), and may be used as an alternative for TNF-alpha.
                                                                                                                                                Savva

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LLG109 is useful for degrading or modifying beta-glucan-contg. material. Its amino acid sequence was deduced from a genomic DNA sequence (AAR729043) isolated from an 0. xanthineolytica library. Recombinant beta-1,3-glucanase can be produced on a large scale using transformed host cells, esp. Bacillus subtilis DN1885 or ToC46. Protease-free beta-1,3-glucanase can be obtd. that is useful for lysing fungal cell walls, allowing recovery of intracellular proteins. The enzyme is also useful for the prepn. of protoplasts and for the production of pigments, colorants, flavours, yeast extract
                                                                                                                                                                                                                   The present invention relates to Mycobacterium tuberculosis secreted proteins (MTSP), where the polypeptide has M. tuberculosis specific antigenic and immunogenic properties. Compositions of the invention may be useful for diagnosing Mycobacterium tuberculosis infection and as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             04-MAY-1999;

                                                                                                                         (see AAT89155). Claimed DNA constructs that encode the hovel of the last of AAW29456 for corrected sequence), a mannose binding domain (see AAW29458) or a full-length enzyme, i.e. BG with mannose binding domain (see AAW29456), can be used to produce recombinant BG polypeptides, with or without a mannose binding domain, in fungal or bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the

                                                                                                                                                polypeptides, with or without a mannose binding domain, in fungal or bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the production of e.g. pigments, colourants, flavourants, yeast
                                                                                                                                                                                                                                                        This sequence comprises the polypeptide precursor of a novel oerskovia xanthineolytica enzyme that exhibits beta-1,3-glucanase (BG) activity. Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAT89157). Claimed DNA constructs that encode the novel BG (see also AAW29455), a mannose binding domain (see AAW29458) or a full-length enzyme, i.e. BG with mannose binding domain (see AAW29456), can be used to produce recombinant BG binding domain (see AAW29456), can be used to produce recombinant BG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Key

Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAT89156). Claimed DNA constructs that encode the novel BG lacking a MBD (see AAW29455 and AAW29457), a MDB (see AAW29455), or the full-length enzyme can be used to produce recombinant BC polypeptides, with or without a mannose binding domain, in fungal or bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the

                                                                                                                                                                                                                                                                                                                                                                                          The new enzyme is derived from alkaophhilic Bacillus Sp. The enzyme acts on beta-1,3-glucans to form glucose and laminaribiose. It is stable over a wide pH range with opt. activity at weakly actdic pH and has good heat resistance.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the deduced amino acid sequence of the C-terminal three quarters of a corn beta-carotene hydroxylase derived from isolated CDNA clones (see AAZ34967). The enzyme converts beta-carotene into Zeaxanthin. The invention provides movel carotenoid biosynthesis C enzymes, specifically beta-carotene hydroxylase, lycopene cyclase C and lycopene epsilon cyclase (see AAZ34967-74). The enzymes may be polynucleotides encoding them (see AAZ34967-74). The enzymes may be create transgenic plants in which the enzymes may be compared recombinantly and used to raise antibodies, used for C prepared recombinantly and used to raise antibodies, used for C detecting the enzymes is situ or in vitro. The polynucleotides may be compared to the enzymes in situ or in vitro. The polynucleotides may be used to create transgenic plants in which the enzymes are c compared to the enzymes or C developmental processes where they are not normally found. This would alter the level of alpha-carotene or beta-carotene in those cells. Zeaxanthin gives a consumer-preferred darker colour to yolks alocking of beta-carotene hydroxylase activity may create a high beta-carotene corn which may be valuable for human consumption. The enzymes can also be used as targets to facilitate the design cand/or identification of inhibitors of those enzymes that may be confided as herbicides. This is desirable because inhibition of any of the enzymes could lead to an inhibition of plant growth.

                                      is useful as a constituent in additives, detergent compositions and other cleaning compositions, optionally in combination with other enzymes such as proteases, lipases, cellulases, anylases, peroxidases or oxidases. The variants of RP-II have improved properties such as substrate, specificities, catalytic rate, stability, especially in peroxidases. The action of proteolytic enzymes and improved properties such as substrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        26-OCT-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                    This invention describes a novel isolated nucleic acid (I) from the genome of phage phi-CH1 of Natrialba magadii. The genome of phi-CH1 is a combination of 48300 and 10198 base pair sequences (S1 and S2), both the fully defined in the specification. The invention also describes a novel (I) recombinant vector (RVI) containing the ori of phi-CH1; (3) cell transformed with RVI or RV2; (4) isolated polypeptide (II) encoded by (I); N. magadii cells free from the prophage of phi-CH1; (5) phage variants having lytic properties different from those of wild-type phi-CH1 and having genomic sequences at least 70 % homologous with the phi-CH1 genome; (6) use of phi-CH1 as gene transfer vector; and (7) use of halophilic Archaea for production of proteins and other polymers. Specifically N. magadii, for production of proteins and other polymers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

Primary structure of BMK1: a new mammalian map kinase.";

Primary structure of BMK1: a new mammalian map kinase.";

Blochem. Biophys. Res. Commun. 213:715-724(1995).

-1- FUNCTION: MEK5 AND ERK5 INTERACT SPECIFICALLY WITH ONI-
NOT WITH MEK1/ERK1 OR MEK2/ERK2 PATHWAYS.

-1- ENZYME REGULATION: ACTIVATED BY TYROSINE AND THREONIN-
PHOSPHORYLATION (BY SIMILARITY).

-1- TISSUE SPECIFICITY: EXPRESSED IN MANY ADULT TISSUES.

-1- TISSUE SPECIFICITY: EXPRESSED IN MANY ADULT TISSUES.

Baumann A., Frings S., Godde M., Seifert R., Kaupp U.B.;

Primary structure and functional expression of a Drosophila cyclic nucleotide-gated channel present in eyes and antennae.";

EMBO J. 13:5040-5050(1994).

-I- FUNCTION: APPROXIMATELY 50-FOLD MORE SENSITIVE TO CGMP THAN TO CAMP. MAY BE INVOLVED IN TRANSDUCTION CASCADES OF BOTH INVERTEBRATE PHOTORECEPTORS AND OLFACTORY SENSILLAE.

-I- TISSUE SPECIFICITY: EXPRESSED IN ANTENNAE AND THE VISUAL SYSTEM.

-I- SIMILARITY: BELONGS TO THE CYCLIC NUCLEOTIDE-GATED CATION CHANNEL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PROSITE; PS00751; TCP1_2; 1.
